

AI-based services to help high school senior in their post high school decision

ABOUT RESEARCH PROJECT

Hi, my name is Simone Dalledonne, I am a master student in Innovation Management Engineering at Polytechnic of Turin. I am currently in Tallinn, writing my master thesis in collaboration with the e-governance department at Tallinn University of Technology. My research project is about a problem very common in the high school senior in Italy but also in other state in all over the world. The problem concerns the difficulty of the new generations to decide the right path after the high school, and in Italy it is highlighted by the percentage of NEET that reaches 22%. This case study research studies the implementation of AI-based services designed to provide suggestions to students, to give them more awareness and to take better decisions about their future and post-high school life. To get a good result from the research, it will be necessary to interview and collaborate with experts in the field of AI, expert in Education system, Italian high school professors, and students with bad post high school experiences or who still have to make the decision.
