Honors thesis

COURSE OF ARCHITECTURE CONSTRUCTION CITY

After arriving to the conclusion that the division of the city of Bogotá is not dual, but fragmented and capable of regeneration through the continuous work from its inhabitants, we have focused on a small-scale reality of the city, which lies in the boundary between urban and rural, using a particular case-studio such as *La Cecilia* neighbourhood.

Analysing the dynamics of the anthropomorphic territory, of its inhabitants, and the ways of building and living the public and private space and combining a bottom-up and top-down approach, we tried to give visibility to a part of the city still invisible through a possible design scenario, the result of a link between architectural technique, environmental infrastructure and anthropology.

The thesis work has two main objectives: on one hand, the thesis address the problem of the informal city and its possibilities for improvement, consolidation and mitigation of environmental risks; on the other hand, it is a participatory field work with the community, which seeks to design alternatives resettlement plan for the community analyzed.

La Cecilia neighborhood

A design scenario for a visible and resilient city
