Preoperative data - Measures and questionnaire

Informations about Measures and questionnaire

Cough test: if the Cough test is positive, here you can enter the volume of full bladder when the test was performed;

Pad test: here you can enter the patient's pad weight following a one-hour pad test;

PVR: Post Void Residual urine test measures the amount of pee that remains in bladder's patient after the urination;

VLPP: Valsalva leak point pressure is the lowest value of the intentionally increased intravesical pressure that provokes urinary leakage in the absence of a detrusor contraction. The increase in pressure is induced by the Valsalva maneuver (Valsalva LPP);

Qmax: maximum flow rate;

Pdet Qmax: detrusor pressure at Qmax;

Questionnaire

Questionnaire type:

Questionnaire score:

Informations about
Questionnaire's score

Even though the I-QOL is a number ranging between 0 and 100, you have to insert the sum of the score of each item as the questionnaire's score and the system will automatically convert it into a number from 0 to 100

As for the other questionnaires you have to insert the sum of the score of each item

Reference Values for *Questionnaire's score*

I-QOL

score ≤ 50 : significant impact of UI on QOL
50 < score < 75: moderate impact of of UI on QOL
score ≥ 75 : significant impact of UI on QOL

UDI-6

score < 5: urogenital symptoms are rare/not present
6 < score < 11: moderate presence of urogenital symptoms
12 < score < 18: high presence of urogenital ssymptoms
