

1)First, download and install Python from the following link:
<https://www.python.org/downloads/>

2)After installing Python, install Django with the following command in cmd:

Pip install Django

3)After installing Django, extract the project and run it with the following commands:

-First, open cmd and go to the project folder,

Using `cd ..` we go back and `cd foldername` to the next folders

-When we get inside the folder final -> project-hamber -> scripts by writing the command "activate" We activate the virtual machine.

-Pay attention that when the virtual machine is activated, we will see its name in parentheses behind our writing in CMD
In this way (project-hamber)

-Then we go back to the back folders and go into the hamber folder (all this happens in cmd)

-And with the command "python manage.py runserver" We implement the project

-Then enter the browser and type in the url field:

"http://127.0.0.1:8000" Now you can view your site.

-Enter the admin page by typing "http://127.0.0.1:8000/admin" in the url field.

Username: admin
